

## Alternate Method To Align Keel with Hull - Philip Hubbell

Keel web is held perpendicular to the bottom of the hull between two small carpenter squares. The squares are held against the web and against the hull by rubber bands. No "sighting" or judgement calls are required. Hull does not have to be maintained level. **Note that the web has been pre-shaped, but the keel bulb has not yet been attached.**

From above: Use what ya got. From below: Two of the ell-shaped squares would have been easier. Again: "Level" is immaterial. (File folder drawers "work station" proved indispensable throughout the build!)
